

Breast Model: Four-Stage Training Diagnostics

T0 to T3 run | 764 training patients; 102 development-validation patients | 2026-09-28 to 2026-09-29

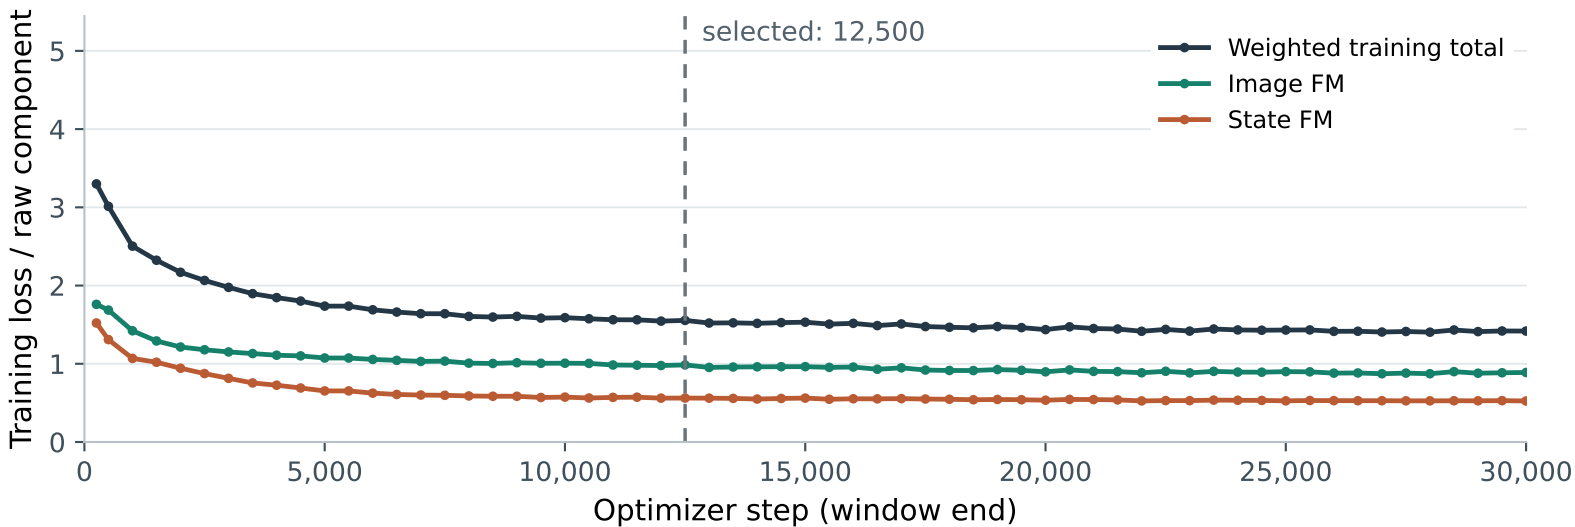

1. Representation | sampled training windows

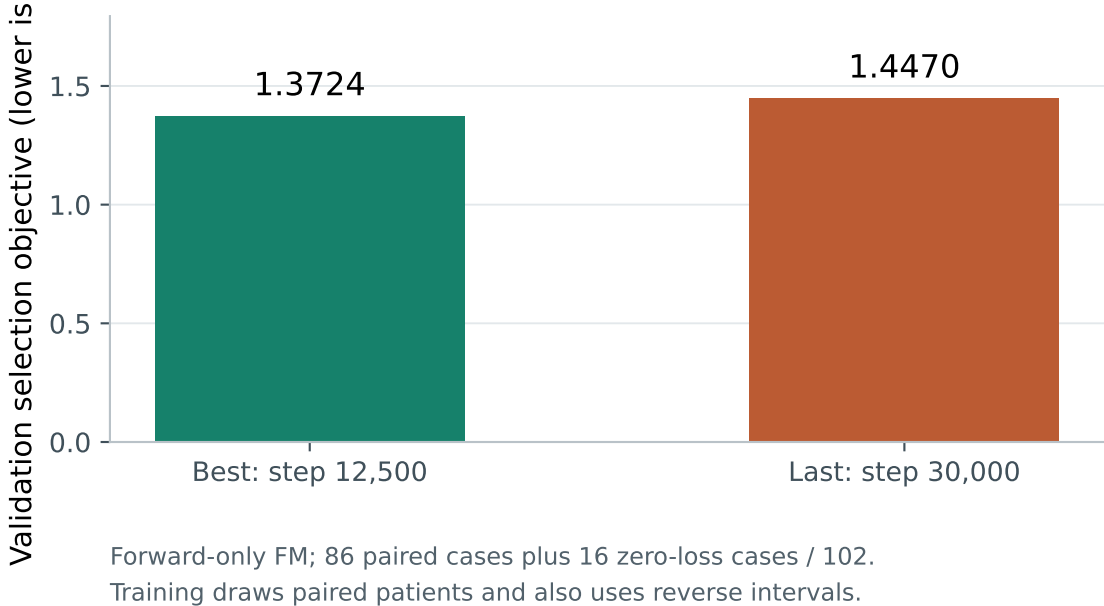

Saved validation snapshots (NOT a full curve)

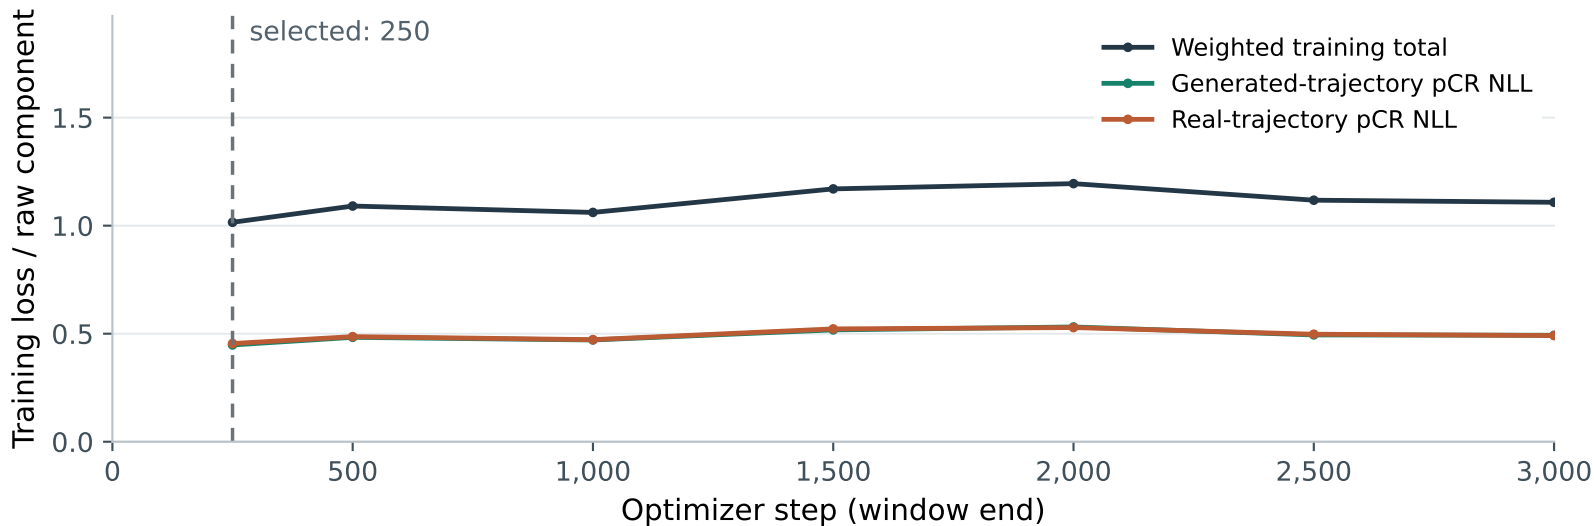

2. Flow | sampled training windows

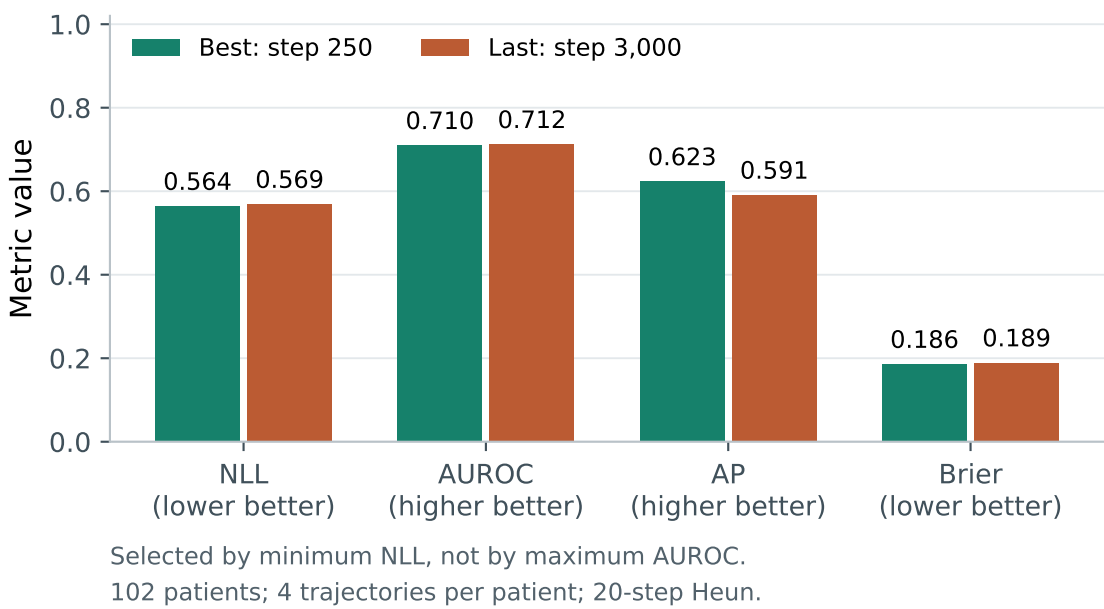

Saved validation snapshots (NOT a full curve)

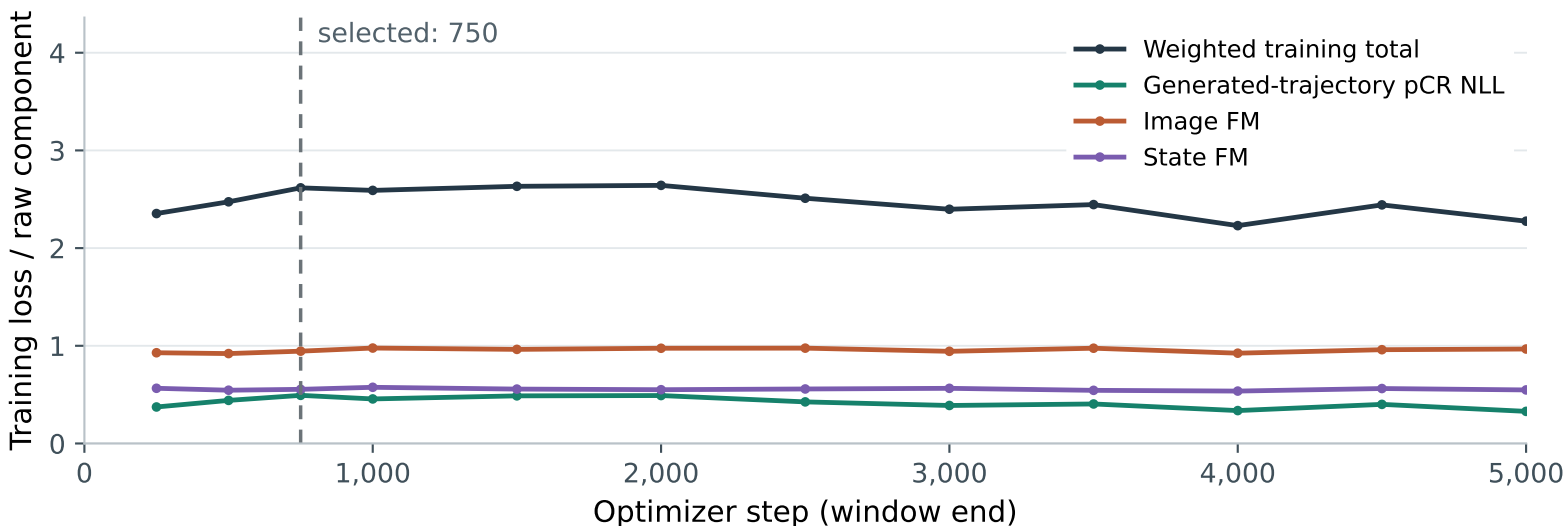

3. Readout | sampled training windows

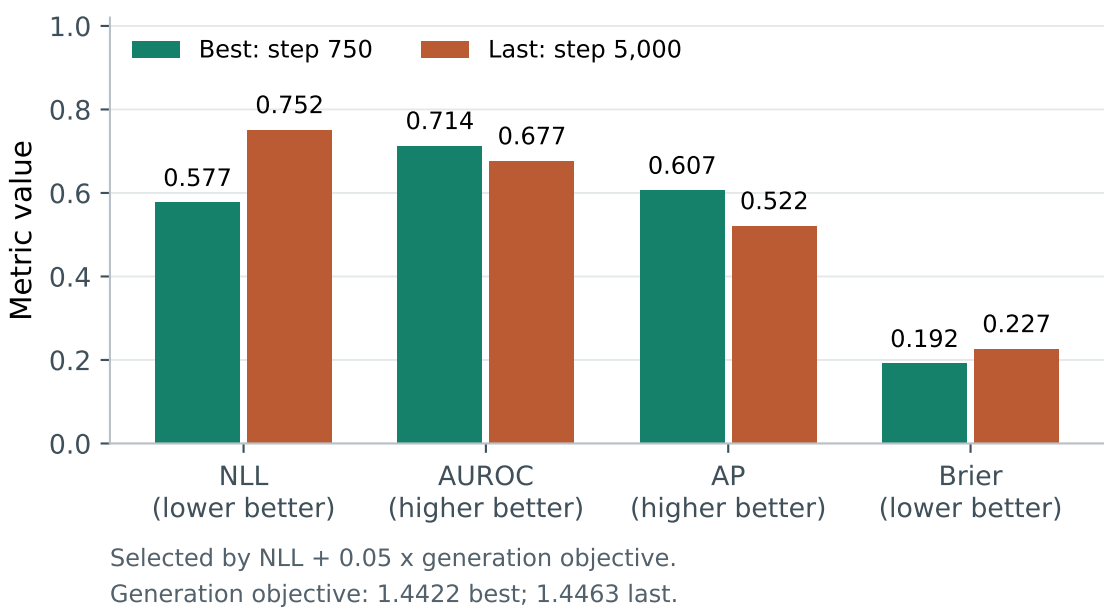

Saved validation snapshots (NOT a full curve)

4. Joint | sampled training windows

Saved validation snapshots (NOT a full curve)

Training points: step 250, every 500 steps, and the selected step; each mean uses up to 50 preceding logged batches (one log / 10 steps).

At step 250, only 25 logs are available. Lines connect aggregate windows; they are not the full training history.

Validation: only retained best and last snapshots. Loss definitions and sampling differ across stages; compare each stage internally.

Development results only, not independent-test results. The generation objective does not measure MRI image quality.
